EASTWIND GOURMET · FROM A MONDAY GUESS TO A MONDAY ORDER

Forecast-driven replenishment

Order festival gifts for the week the festival falls, not the week it fell last year.

Prepared for your VP Merchandising and CIO

October 2026

THE BUSINESS PROBLEM

Festivals move. Orders don’t.

$17.8M/yr

lost sales from empty shelves across your 80 stores

$10.3M/yr

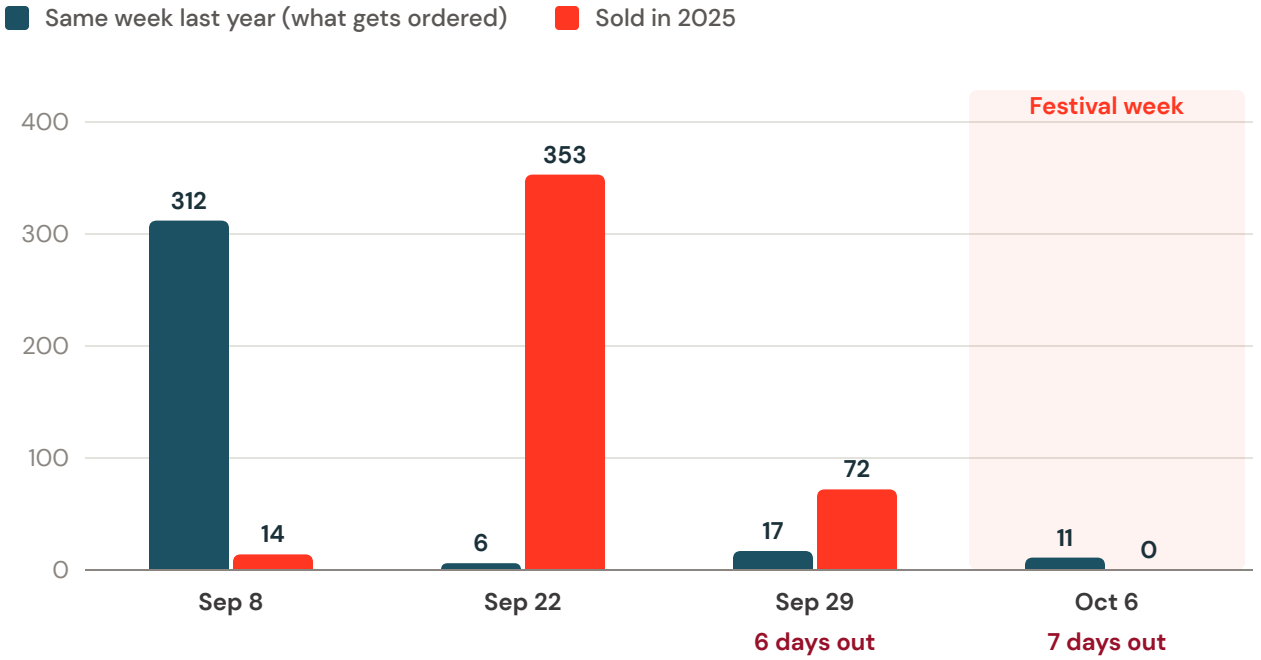

of that on peak gifts, the products customers buy for festivals

1 in 5

peak-gift shelves empty at Mid-Autumn, more than twice the usual rate

ZHONGSHAN SHOP · CLASSIC LOTUS MOONCAKE BOX · MID-AUTUMN 2025

Stocked for 2024’s peak, out of stock for 2025’s

Mid-Autumn fell on Sep 17 in 2024 and Oct 6 in 2025. Ordering by last year’s calendar week stocked this line for the wrong week.

WHY IT'S HARD TODAY

Three things in the way

01

Fragmented feeds

POS · ERP inventory · Product catalog · Store master · Holiday calendar

Different owners, formats, and refresh cycles. Even your store IDs differ: DT001 vs L0001.

WHAT IT COSTS YOU

No single view of demand, so every forecast starts from a spreadsheet.

02

Stockouts hide demand

When the shelf is empty, sales stop. Your history records what sold, not what customers wanted.

WHAT IT COSTS YOU

History understates the peak, so next year's order is short again.

03

The usual fix: six tools

ETL tool · Warehouse · ML platform · OLTP database · BI / chat · App hosting

Each hop adds a copy, a handoff, and another set of permissions to keep in sync.

WHAT IT COSTS YOU

Slow, costly projects, and access rules that drift apart.

HOW DATABRICKS HELPS

What this project delivers

BUSINESS OBJECTIVES · VP MERCHANDISING

$2–3M/yr

Win back peak-gift sales

Order for the week the festival falls. Target: 20–30% of today's peak-gift lost sales.

Holiday-aware forecast

~15%

Manager time where it matters

Only flagged order lines need a decision. The routine rest are accepted in one step.

Exception-based ordering app

Flat

No extra waste

Fuller festival shelves, with expiry and markdowns held at today's level.

Buffers capped by shelf life

TECHNICAL OBJECTIVES · CIO

01

One governed view of demand

Five source systems unified and quality-checked in one place.

Lakeflow · Unity Catalog

02

An explainable forecast inside ordering

Each recommended order reaches the manager with its reasons; every decision is recorded.

Mosaic AI · Lakebase · Apps

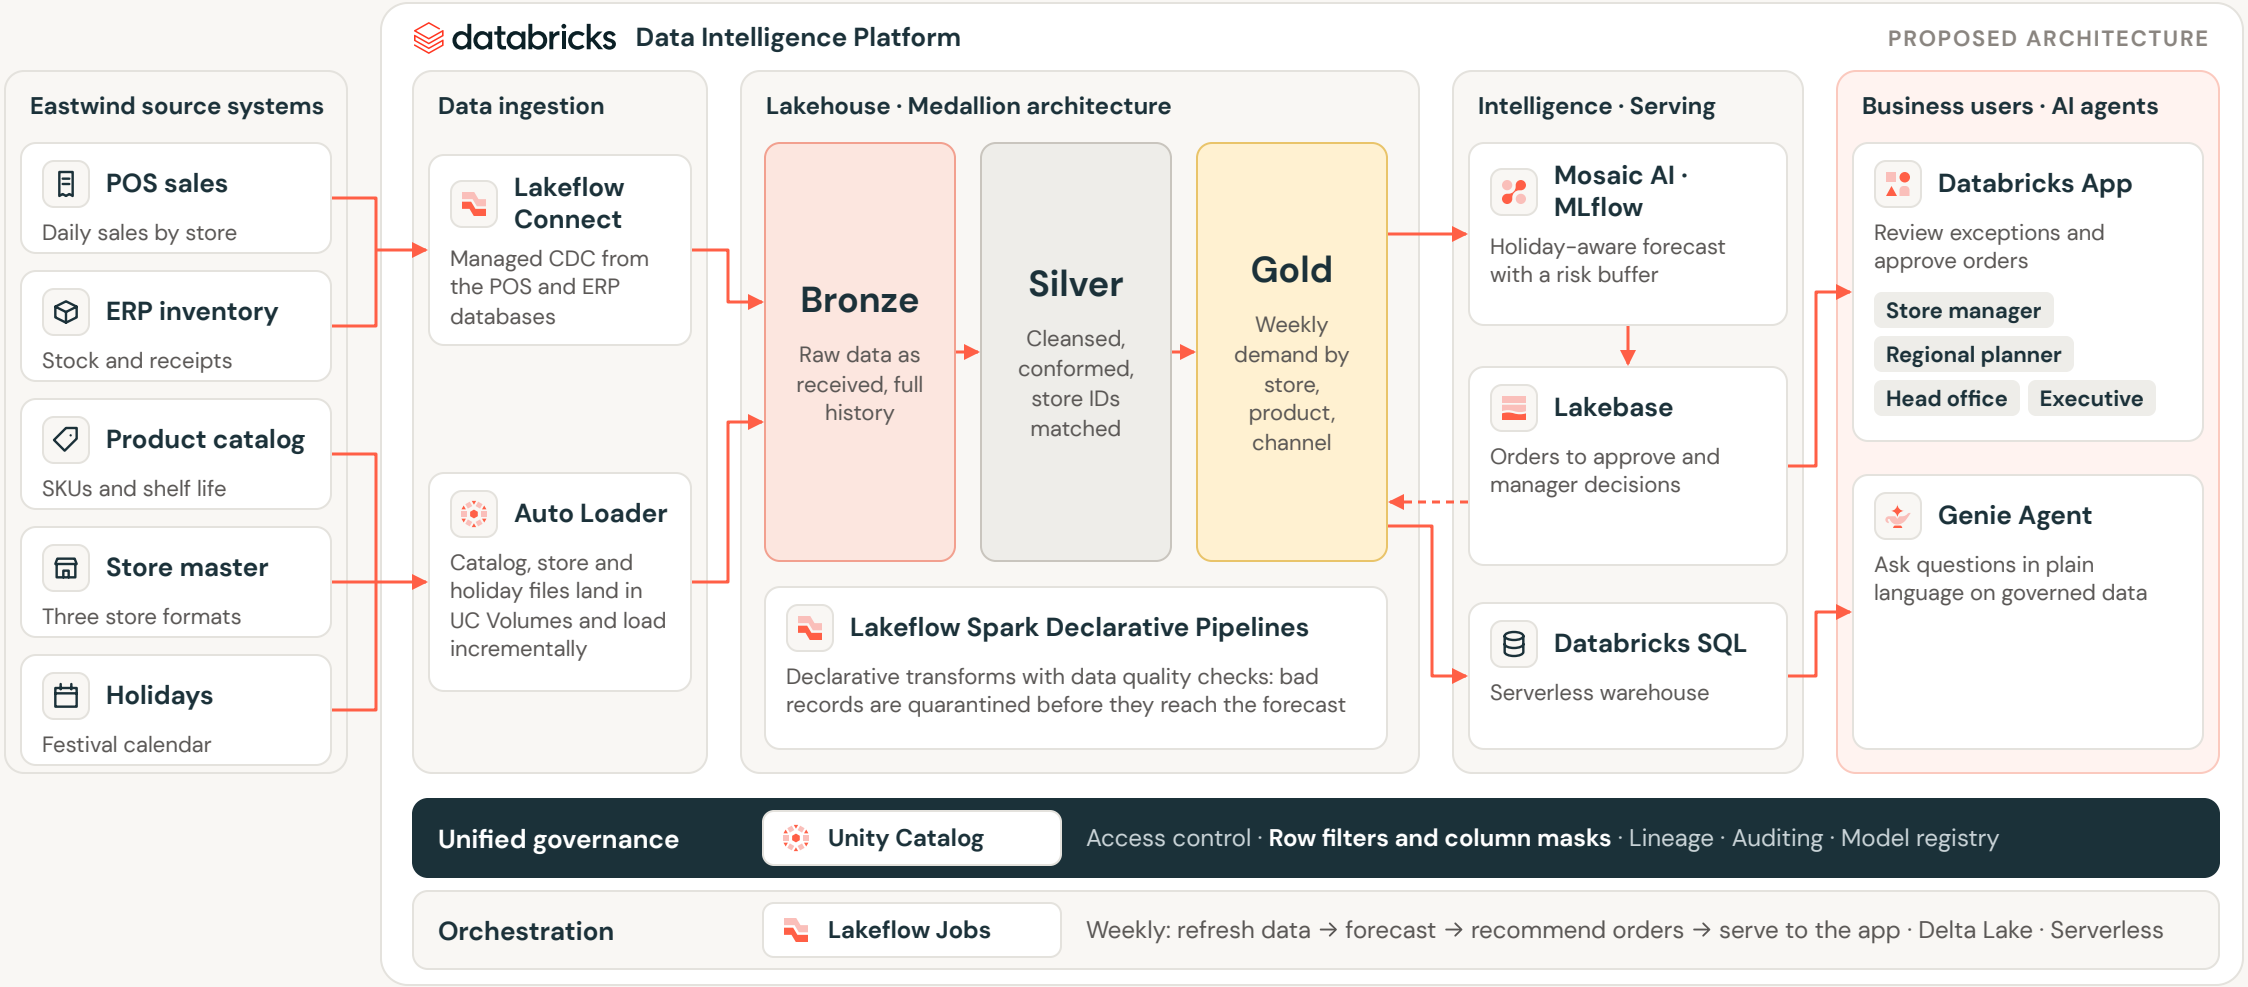

03

Self-service without new risk

Plain-language questions, with the same permissions in the app, SQL and Genie.

Genie · Unity Catalog

One governed platform, from source to order

OUTCOME 1 · UNIFY AND PREDICT

Right quantity, right week

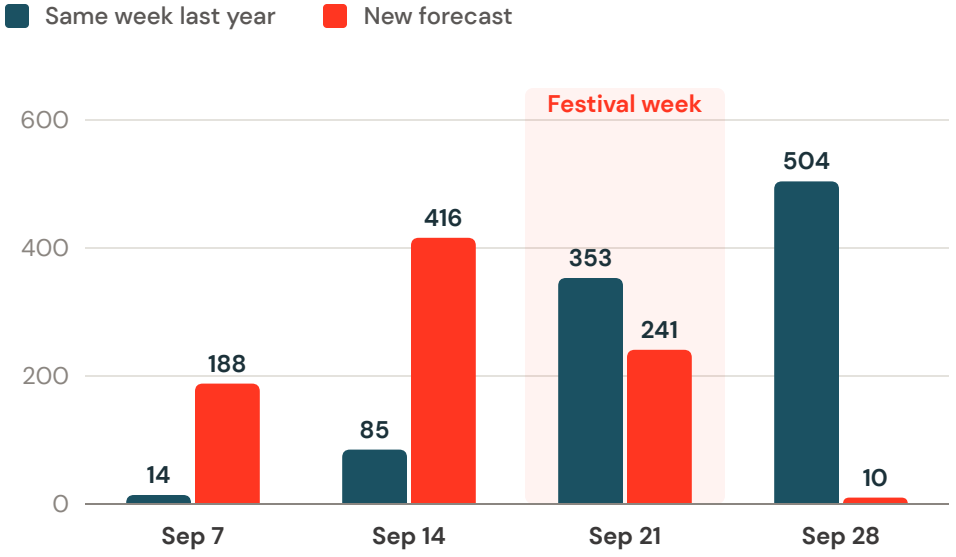

01 **Aligned to the festival**
The forecast compares this year with last year's festival weeks, not last year's calendar weeks.

02 **A buffer sized to the risk**
Every order carries a buffer sized to the risk, so safety stock grows into the peak.

03 **Fewer empty shelves**
Stock lands in the lead-up weeks, when customers actually buy.

ZHONGSHAN SHOP · CLASSIC LOTUS MOONCAKE BOX · 2026

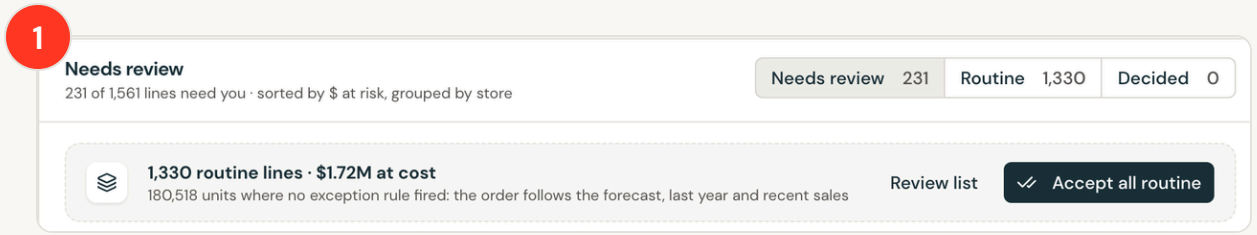

Volume moves into the lead-up weeks

One store and gift box, units per week. Mid-Autumn 2026 falls on Sep 25.

OUTCOME 2 · DECIDE

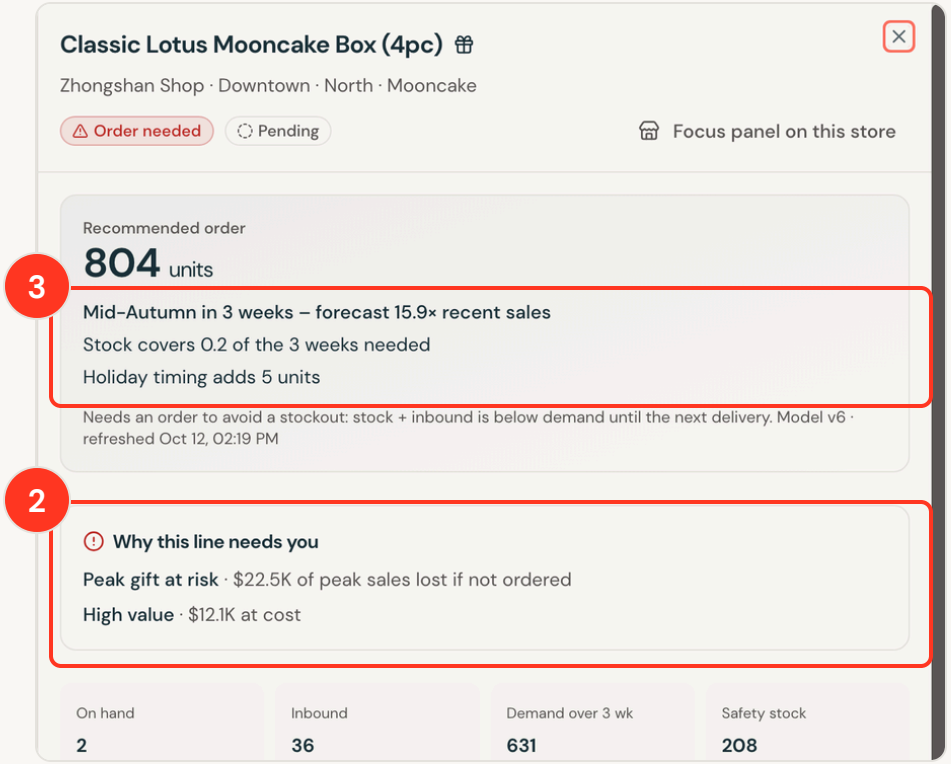

Managers review only the exceptions

1 Only the exceptions need you
About one line in seven is flagged. Routine lines follow the forecast and are accepted in one step.

2 Why this line needs you
Each flagged line says why: a peak gift at risk, or an order big enough to check.

3 Why this quantity
Reasons in plain words, such as an upcoming festival or low stock cover, so managers can trust or override it.

OUTCOME 3 · ASK, GOVERNED

Ask anything, see only your stores

Ask Genie

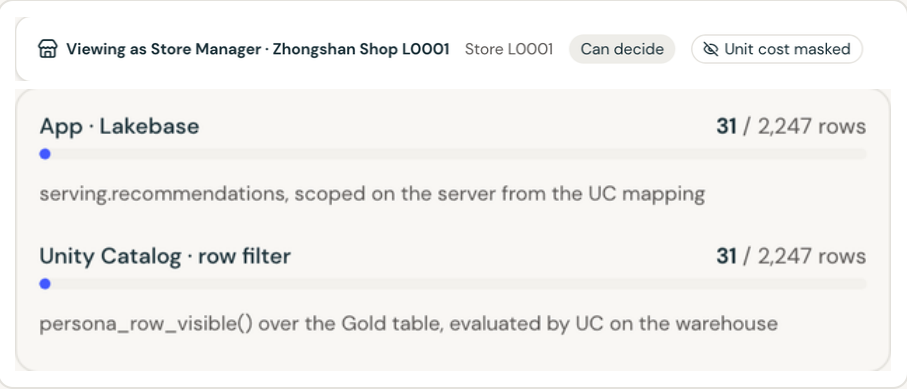

"Which highway stores face the highest Mid-Autumn stockout risk?"

Genie lists the highway kiosks most at risk, ranked by sales at stake.

Runs as you, on governed gold tables, SQL shown.

VIEWING AS · SAME TABLE, DIFFERENT ACCESS

PERSONA	SEES	UNIT COST
Head-office analyst	All stores	Visible
Regional planner, North	North region only	Visible
Store manager, Zhongshan Shop	Own store only	Masked

One set of permissions, enforced everywhere: in the app, in SQL and in Genie.

Defined once in Unity Catalog as a row filter and a column mask.

FOR THE CIO

Lineage from every order back to its source system

Bad records quarantined before they reach the forecast

Every manager decision audited

WHAT CHANGES FOR YOU

How your Monday changes

TODAY	WITH DATABRICKS
Order by gut feel and last year's calendar week	Order for the festival week, with a buffer sized to the risk
Peak gifts run out before the festival	Volume lands in the lead-up weeks, when customers buy
Every line approved by hand	Review the ~15% of lines that need you; accept the routine rest in one step
POS, ERP, catalog, store, and holiday data apart, with no single view	One governed view in Unity Catalog; ask Genie, and decisions flow back to gold

SUGGESTED NEXT STEP

Plan your next order week together

Connect your POS and ERP, review the first order week with your planners, and see your own peak-gift exposure before the next Lunar New Year.
